
This guidance is designed to help healthcare providers (HCPs) determine when to test for SARS-CoV-2 and how to interpret test results. It does not cover all potential scenarios but rather provides a framework that allows healthcare providers to apply their clinical judgment based on each patient’s symptoms and potential exposures. For additional information, see coronavirus.dc.gov/phasetwo.

General Information:
There are two categories of tests available for diagnosing a current COVID-19 infection: PCR (polymerase chain reaction) and antigen tests. PCR tests are the gold standard for the diagnosis of COVID-19, with high sensitivity and specificity. Antigen tests are quick, inexpensive and convenient but are less sensitive than PCR tests. Antigen tests perform best in persons with symptoms consistent with COVID-19 infection. The interpretation of antigen test results in other clinical scenarios is less straightforward. Serology testing detects antibodies made in response to a past infection with SARS-CoV-2 and should not be used to diagnose active infection. For additional information, please refer to PCR, Antigen and Antibody Tests at coronavirus.dc.gov/phasetwo and to the DC Health Notice SARS-CoV-2 Antigen Testing-Outpatient Settings at dchealth.dc.gov/page/health-notices.

General Quarantine Recommendations:
Close contacts of persons with confirmed COVID-19 must quarantine. A close contact is someone who was within 6 feet of an infected person for at least 15 minutes cumulatively over a 24-hour period, while the person was infectious. While 14-day quarantine is the safest option, ending quarantine after 10 days may be acceptable. Close contacts who end quarantine after 10 days should continue to self-monitor for symptoms for a full 14 days.

Quarantine Exceptions:
Persons who have been identified as a close contact of a person with COVID-19 are NOT required to quarantine if:

- They have had COVID-19 (symptomatic or asymptomatic) within the last 90 days AND do not have any symptoms suggestive of COVID-19 infection
- They are fully vaccinated against COVID-19 AND do not have any symptoms suggestive of COVID-19 infection.

NOTE: Persons who are not required to quarantine must still self-monitor for symptoms for 14 days after the date of their exposure. If symptoms of COVID-19 develop during this time period, they must isolate and follow-up with their healthcare provider for testing. For more information regarding quarantine please see Guidance for Quarantine after COVID-19 Exposure at coronavirus.dc.gov/phasetwo.
Reinfection:
Current evidence suggests that reinfection is uncommon during the initial 90 days after symptom onset of a preceding SARS-CoV-2 infection (or 90 days after a positive test date for asymptomatic infections). For patients recovered from SARS-CoV-2 infection, a positive PCR without new symptoms during this 90-day time frame is more likely to represent persistent shedding of viral RNA than reinfection.

- Determination of a possible reinfection should be made on a case-by-case basis.
- For asymptomatic patients, re-testing is unlikely to yield useful information even if the patient had close contact with an infected person.
- If a patient develops new symptoms of COVID-19 during this 90-day period and an evaluation fails to identify an alternative diagnosis (e.g., influenza), then the patient may warrant re-evaluation for SARS-CoV-2 reinfection in consultation with an infectious disease expert.
  - Consider isolation and testing, particularly if there is a known exposure within the preceding 14 days. If reinfection is confirmed or remains suspected, patients should continue isolation until criteria for discontinuation is met.
- For more information about reinfection, refer to the Centers for Disease Control and Prevention (CDC) article Duration of Isolation and Precautions for Adults with COVID-19 at [cdc.gov/coronavirus/2019-ncov/hcp/duration-isolation.html](http://cdc.gov/coronavirus/2019-ncov/hcp/duration-isolation.html).

For more information about isolation and discontinuation of isolation please see Guidance for Persons Who Tested Positive for COVID-19 and Interim Guidance on Discontinuation of Transmission-Based Precautions for Patients with Confirmed or Suspected COVID-19 in Healthcare Settings at [coronavirus.dc.gov/phetwo](http://coronavirus.dc.gov/phetwo).
Evaluation Algorithm for Healthcare Providers – Symptoms & No Known Exposure

START: Individual presents for evaluation of COVID-19 symptoms.

DC IS IN PHASE 0/1 OR 2
Test for COVID-19 & instruct the individual to ISOLATE at home pending results.

DC IS IN PHASE 3 OR 4
Consider alternate diagnosis. Test for COVID-19 if high clinical suspicion.

Was the COVID-19 test result (+) positive?

Yes

Have 90 days or more passed since the individual had a prior laboratory confirmed COVID-19 infection?

No

Go to: “Reinfection” section of this document on PAGE 1.

Yes

Was the COVID-19 test result (+) positive?

No

Test for COVID-19 & instruct individual to ISOLATE at home pending results.

Yes

Was an alternate diagnosis made?

No

Individual should have improved symptoms with no fever for at least 24 hours without fever-reducing medicine & feel better before resuming normal activities.

Yes

Individual should have improved symptoms with no fever for at least 24 hours without fever-reducing medicine & feel better before resuming normal activities.

Pursue differential diagnosis and treat as appropriate. Consider repeat test in 3-5 days for high clinical suspicion or if no alternative diagnosis is made. (Repeat previous step if tested.)

Instruct individual to ISOLATE for at least 10 days from symptom onset. Close contacts should begin QUARANTINE.

If Retested

Symptoms of COVID-19 may include: fever (subjective or 100.4 degrees Fahrenheit), chills, cough, shortness of breath or difficulty breathing, fatigue, muscle or body aches, headache, new loss of taste or smell, sore throat, congestion or runny nose, nausea or vomiting, diarrhea, or otherwise feeling unwell.

Testing: PCR or antigen (Ag) testing is acceptable. If an Ag test is negative and clinical suspicion for COVID-19 is high, confirm with PCR, within 2 days of the initial Ag test.

Quarantine Duration: 14 day quarantine is the safest option. Ending quarantine after 10 days may be acceptable. Exceptions for quarantine after exposure may be appropriate for individuals with a history of COVID-19 infection in the previous 90 days and those who are fully vaccinated. Guidance on reduced quarantine period can be found at coronavirus.dc.gov/healthguidance.

Household Close Contacts Quarantine Duration: Household members unable to isolate from a positive individual are considered “exposed” for the duration of the positive individual’s isolation period. Household members should begin quarantine period beginning from the last day of exposure. For more information see guidance for “Contacts of a Person Confirmed to have COVID-19” at coronavirus.dc.gov/healthguidance.

Duration of Isolation: Consider isolating for up to 20 days for severe illness or immunocompromised individuals. For more information see dchealth.dc.gov/node/1498616.
Evaluation Algorithm for Healthcare Providers –
★ Close Contact Exposure to Confirmed COVID-19 Case

START:
Individual presents for evaluation after close contact with a COVID-19 (+) positive individual.

Has the individual ever been diagnosed with a laboratory confirmed COVID-19 infection?

Yes ➡️

Individual should monitor for symptoms and continue everyday prevention measures.

If Symptoms Develop ➡️

No ➡️

Have 90 days or more passed since the individual had a prior laboratory confirmed COVID-19 infection?

Yes ➡️

Instruct the individual to ★QUARANTINE at home & monitor for symptoms. Test 3-5 days after exposure.

No ➡️

Does the individual have symptoms of COVID-19 infection?

Yes ➡️

After completing isolation, individual should have improved symptoms with no fever for at least 24 hours without fever-reducing medicine & feel better before resuming normal activities.

No ➡️

Was the COVID-19 test result (+) positive?

Yes ➡️

Instruct individual to ★QUARANTINE.

No ➡️

Test for COVID-19 & instruct individual to ISOLATE at home pending results.

Was the COVID-19 test result (+) positive?

Yes ➡️

After completing isolation, individual should have improved symptoms with no fever for at least 24 hours without fever-reducing medicine & feel better before resuming normal activities.

No ➡️

Consider alternate diagnosis & ★QUARANTINE. Consider repeat test in 3-5 days for high clinical suspicion. (Repeat previous step if retested.)

Individual should monitor for symptoms and continue everyday prevention measures.

GO TO: “Reinfection” section of this document on PAGE 1.

No ➡️

Was the COVID-19 test result (+) positive?

Yes ➡️

After completing ★QUARANTINE, individual may resume normal activities & follow everyday prevention measures.

No ➡️

Instruct individual to ★QUARANTINE.

★ Close Contact is defined as being within 6 feet of a person with COVID-19 infection for 15 minutes or more within a 24 hour period or having direct exposure to respiratory secretions.

★ Symptoms of COVID-19 may include: fever (subjective or 100.4 degrees Fahrenheit), chills, cough, shortness of breath or difficulty breathing, fatigue, muscle or body aches, headache, new loss of taste or smell, sore throat, congestion or runny nose, nausea or vomiting, diarrhea, or otherwise feeling unwell.

Testing: PCR or antigen (Ag) testing is acceptable. If an Ag test is negative and clinical suspicion for COVID-19 is high, confirm with PCR, within 2 days of the initial Ag test.

Quarantine Duration: 14 day quarantine is the safest option. Ending quarantine after 10 days may be acceptable. Exceptions for quarantine after exposure may be appropriate for individuals with a history of COVID-19 infection in the previous 90 days and those who are fully vaccinated. Guidance on reduced quarantine period can be found at coronavirus.dc.gov/healthguidance.

Household Close Contacts Quarantine Duration: Household members unable to isolate from a positive individual are considered “exposed” for the duration of the positive individual’s isolation period. Household members should begin quarantine period beginning from the last day of exposure. For more information see guidance for ‘Contacts of a Person Confirmed to have COVID-19’ at coronavirus.dc.gov/healthguidance.

Duration of Isolation: Consider isolating for up to 20 days for severe illness or immunocompromised individuals. For more information see dchealth.dc.gov/node/1490616
### Test Interpretation for Healthcare Providers

<table>
<thead>
<tr>
<th>Reason for Visit/Question</th>
<th>Has the person had symptoms?</th>
<th>Type of COVID-19 test</th>
<th>Recommendations</th>
</tr>
</thead>
</table>
| Positive SARS-CoV-2 Test Result | NO | PCR test | • Isolate. For information about when to discontinue isolation, see DC Health Notice *Updated Priorities for COVID-19 Testing, Guidelines for Reporting, and Discontinuation of Home Isolation*.  
• The DC Health Contact Trace Force will follow up to conduct a case investigation.  
• Instruct patient to make a follow-up appointment for evaluation if symptoms develop.  

Rapid antigen test | • Isolate and send confirmatory PCR testing in asymptomatic patients due to low pretest probability of test in this scenario.  
• Confirmed positive results should continue isolation per DC Health Guidance.  
• Patients with confirmed negative results may resume normal activities and follow everyday precautions. |
| YES | PCR test | • Isolate. For information about when to discontinue isolation, see DC Health Notice *Updated Priorities for COVID-19 Testing, Guidelines for Reporting, and Discontinuation of Home Isolation*.  
• The DC Health Contact Trace Force will follow up to conduct a case investigation.  
• Instruct patient to make a follow-up appointment if symptoms worsen or do not improve, or to seek emergency treatment as necessary.  

Rapid antigen test | • Isolate. For information about when to discontinue isolation, see DC Health Notice *Updated Priorities for COVID-19 Testing, Guidelines for Reporting, and Discontinuation of Home Isolation*.  
• The DC Health Contact Trace Force will follow up to conduct a case investigation.  
• Instruct patient to make a follow-up appointment for evaluation if symptoms develop. |
<table>
<thead>
<tr>
<th>Reason for Visit/Question</th>
<th>Has the person had symptoms?</th>
<th>Type of COVID-19 test</th>
<th>Recommendations</th>
</tr>
</thead>
</table>
| Negative SARS-CoV-2 Test Result | NO | PCR | • If tested because of recent known exposure/close contact, quarantine for at least 10 days from date of last contact (please follow employer guidance for returning to work). Exceptions for quarantine after exposure may be appropriate individuals with a history of COVID-19 infection in the previous 90 days and those who are fully vaccinated. Self-monitor for development of symptoms for 14 days.  
• All other patients with confirmed negative results may resume normal activities and follow everyday precautions. |
| Rapid antigen test | NO | PCR | • If tested because of recent known exposure/close contact, continue to quarantine for at least 10 days from date of last contact (please follow employer guidance for returning to work). Exceptions for quarantine after exposure may be appropriate individuals with a history of COVID-19 infection in the previous 90 days and those who are fully vaccinated. Self-monitor for development of symptoms for 14 days.  
• Use of antigen tests in asymptomatic patients with no exposure is off-label and not recommended as results are difficult to interpret. Negative results in this group should be treated with caution if exposure risks are reported (e.g., travel, group activities), and patients should continue to practice everyday prevention measures. |
| YES | PCR | • Perform clinical evaluation to determine if there is an alternative diagnosis for the symptoms.  
• Consider repeat testing if clinically indicated. |
